

pfSense Packages - Bug #11182

NRPE in HA syncs the bind IP

12/21/2020 11:50 AM - Max Leighton

Status:	New	Start date:	12/21/2020
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	NRPE	Estimated time:	0.00 hour
Target version:		Affected Architecture:	
Affected Version:	All		

Description

When using a local interface IP as the bind IP in NPPE 3.1_4, once the primary node resumes master after a failover event, the package settings will sync to the secondary. In this case, the secondary will have the primary's local interface IP set for bind. Binding to the CARP VIP is undesirable because it prevents the user from monitoring both nodes independently.

Steps to reproduce:

1. Install NRPE on both primary and secondary in an HA pair
2. Set the Bind IP Address on each node to its own LAN IP address
3. Failover to the secondary and then failback

The secondary's Bind IP Address will sync to be the LAN interface IP of the primary

History

I can confirm that behaviour as well as 2.4.5p1 and 2.5
