| Description <p>I have a box running 2.0 RC1 with the havp package installed. After upgrading to the June 7 build, the service appears to be running, but the dashboard has only this:</p> <p>Warning: include(/usr/local/www/widgets/widgets/havp_alerts.widget.php): failed to open stream: No such file or directory in /usr/local/www/index.php on line 696 Warning: include(): Failed opening '/usr/local/www/widgets/widgets/havp_alerts.widget.php' for inclusion (include_path='.:etc/inc:/usr/local/www:/usr/local/captiveportal:/usr/local/pkg') in /usr/local/www/index.php on line 696</p> | | | |

- Status changed from New to Rejected

Looks like that file doesn't exist, which means you need to reinstall the package. Some other package may have failed to reinstall, so that one didn't come back. Hard to say, but the build itself didn't break it. The HAVP widget isn't part of the base system.

Indeded, removing and re-installing the package fixed that. Does pfSense remove and re-install all packages every time it updates?

Thanks!

#3 - 06/08/2011 02:49 PM - Jim Pingle

Yes, it reinstalls all packages on every update.
