Description

When trying to login to the admin account via ssh on 2.0, you get:

```
Could not chdir to home directory /home/admin: No such file or directory
```

Then dropped to a # prompt.

If you run "chsh" it shows the home directory should be /root, but when you run vipw it is looking for /home/admin. Change it to /root there and it works as expected.

Scott checked in a fix yesterday, and I just tested it on a fresh 2.0 install and the admin account logs in properly with ssh. It gets the menu, and its home directory is /root as it should be.
