

pfSense - Bug #3063

system will crash after "PowerD" enabled.

07/02/2013 04:18 AM - tx s

Status:	Closed	Start date:	07/02/2013
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	Unknown	Estimated time:	0.00 hour
Target version:		Affected Version:	2.0.x
Plus Target Version:		Affected Architecture:	amd64
Release Notes:			

Description

I am using pfsense as a transparent firewall.

I found the system would be hanged(no any message) in a few minute, after I enabled the "**Use PowerD*" option in "System->Advanced", but it works correctly in 2.0.1.
the same issue at 2.0.2-i386 and 2.0.3amd64.

History

#1 - 07/02/2013 04:51 AM - tx s

Hardware: Intel(R) Pentium(R) Dual CPU E2200 @ 2.20GHz, Normal PC.

I did not find any obvious message about this fault in system log.
I had to press the RESET button, and disabled "Use Powerd" option in one minute.

- Status changed from New to Closed

not likely this is still a problem in 2.2x versions, with FreeBSD 10.1. if it is, it needs to be reported upstream
