Description

The way how the UI is designed in pfsense-2.3.0, the Mobileike Phase-1 entry can only be bound on a single physical interface.

Therefore, if I'm receiving my IPv4 connectivity from my WAN interface, but receiving my IPv6 from a GIF interface, I find myself in a situation where I have to choose whether Mobileike will be served on IPv4 or IPv6, but never both.

The feature-request would be to allow multiple-interfaces to be bound on the Mobileike Phase-1 policy.
